

EXPERIMENT 18

Implement a simple FOPC parser for basic logical expressions using python program.

PROGRAM:

```
expression = input("Enter expression (e.g., Loves(John,Mary)): ")
```

```
if "(" in expression and ")" in expression:
```

```
    predicate = expression.split("(")[0]
```

```
    arguments = expression.split("(")[1].replace(")", "").split(",")
```

```
    print("Predicate :", predicate)
```

```
    print("Arguments :", arguments)
```

```
else:
```

```
    print("Invalid Expression")
```

OUTPUT:

```
arguments = expression.split("(")[1].replace(")", "").split(",")

print("Predicate :", predicate)
print("Arguments :", arguments)
else:
    print("Invalid Expression")
```

```
... Enter expression (e.g., Loves(John,Mary)): loves(John,Mary)
Predicate : loves
Arguments : ['John', 'Mary']
```
