

Experiment 3:

Write program demonstrates how to perform morphological analysis using the NLTK library in Python.

Program:

```
import nltk

from nltk.stem import WordNetLemmatizer

nltk.download('wordnet')

lemmatizer = WordNetLemmatizer()

sentence = input("Enter a sentence: ")

words = sentence.split()

print("\nMorphological Analysis:")

for word in words:

    print(word, "->", lemmatizer.lemmatize(word))
```

Output:

```
sentence = input("Enter a sentence: ")

words = sentence.split()

print("\nMorphological Analysis:")
for word in words:
    print(word, "->", lemmatizer.lemmatize(word))

[nltk_data] Downloading package wordnet to /root/nltk_data...
Enter a sentence: welcome to saveetha university

Morphological Analysis:
welcome -> welcome
to -> to
saveetha -> saveetha
university -> university
```

Implement a finite state machine for morphological parsing. In this example, we'll create a simple machine to generate plural forms.
